

THE QUEST:

One Man's Journey to Put Nigeria on the Global Geospatial Intelligence (GEOINT) Stage

By

Dr. AA Usman

Founder/CEO

RESLARC Group Nigeria

(Remote Sensing and Land Resources Consultants)

&

Founder/Chair, BOT

Geospatial Intelligence Foundation of Nigeria (GIFON)

PART ONE

THE CALL TO ACTION:

PERSONAL ORIGINS & VISION

1.0 Early Influences

I was born into a Nigeria that was brimming with promise but weighed down by the contradictions of underdevelopment, insecurity, and missed opportunities. From my earliest days, I became aware of a reality that would shape my later quest. Nigeria is rich in resources and

talent, yet poor in systems, structures, and intelligence driven decision making. My academic journey exposed me to the world of geography, mapping, and spatial sciences. What began as an intellectual curiosity soon became a professional calling. The study of maps, terrain, data, and human movement fascinated me not merely for their academic worth, but for their potential to transform how nations think about power, security, and development.

In those formative years, I began to recognize a truth, Nigeria was navigating the complexities of modern threats without the benefit of modern map tools. Wars and rebellions depend not only on force, but also on information, tactics, intelligence, and planning. Yet our country, Africa's most populous nation and a giant in potential, do not have a systematic framework for Geospatial Intelligence (GEOINT), the fusion of imagery, mapping, and data analysis to drive defense, security, diplomacy, and development. That absence would become the vacuum I felt compelled to fill.

1.1. The Early Spark:

Planting a Seed in the 1990s

In 1995, while Nigeria was still struggling with political instability and economic uncertainty, I founded RESLARC.

- At the time, geospatial sciences were virtually unknown in mainstream Nigerian discourse.
- Satellite imagery and GeoIntelligence were tools reserved for global powers, the United States, Russia, and later China.
- I saw something different: *the same tools could secure Nigeria, fuel its development, and position it as Africa's geospatial leader.*

This was not a fashionable idea. It was lonely, difficult, often dismissed. But it was the beginning of a lifelong quest.

1.2. The Building Years:

RESLARC as a Pioneer

Throughout the late 1990s and early 2000s, RESLARC became a quiet incubator of ideas:

- Training a small cadre of analysts in mapping, GIS, and early remote sensing.
- Building partnerships with universities and government agencies, often with little funding but strong conviction.
- Establishing RESLARC Academy to nurture young talents.
- Slowly introducing geospatial applications in defense, agriculture, environmental monitoring, and more.

Every workshop, every training, every field project was a stone laid on the path to something larger.

1.3. The Vision Broadens:

From National to Continental Thinking

By the 2010s, I had begun speaking not just about Nigeria but about Africa's place in the global Geointelligence landscape.

- I know that without geospatial capacity, Nigeria would remain blind in the 21st-century battlespace.
- Geointelligence is not just about war, but about food security, disaster response, urban planning, and diplomacy.
- My papers and lectures often carried the refrain:
“Geography is destiny. But intelligence makes geography power.”

What was once a small company's advocacy is becoming a national security doctrine in waiting.

1.4. The Turning Point:

The Birth of GIFON

In the 2020s, global realities sharpened Nigeria's urgency:

- Boko Haram insurgency, farmer–herder conflicts, piracy in the Gulf of Guinea, climate–induced floods.
- International partners were using geospatial tools to study Nigeria, but Nigeria was not yet studying itself.

It is against this backdrop that I championed the creation of the Geospatial Intelligence Foundation of Nigeria (GIFON).

- GIFON is envisioned as Nigeria’s first dedicated platform to institutionalize geospatial intelligence.
- It would bring together government, military, academia, industry, and international partners.
- Its mission is clear: *“Mapping the Future. Empowering the Nation.”*

From a private sector idea born in RESLARC, a national institution with global ambition was born.

1.5. From RESLARC to GIFON:

The Arc of History

What began as a single company in 1995 evolved into a continental conglomerate by the mid–2020s.

- RESLARC proved that geospatial science had a place in Nigeria.

- GIFON institutionalized that place and carried it to the international stage.
- The dream that once seemed radical is now recognized as indispensable to Nigeria's survival and Africa's rise.

1.6. Early Signs of the Gap

I remember vividly sitting in meetings where traditional intelligence briefings were presented. Reports were often pages of words: who said what, who moved where, who was suspected of what. But as I listened, I found myself asking, ***can we see this on a map? can we visualize the relationship between these events?***

The truth was stark, our intelligence was text heavy, fragmented, and disconnected from the geospatial dimension. Without maps, models, or location-based analysis, decision makers were left with abstractions rather than insights. Meanwhile, across the world, nations were transforming how they used intelligence. The United States, through its National Geospatial Intelligence Agency (NGA), had made GEOINT a cornerstone of both defense and humanitarian operations. Europe was building its Copernicus Program to monitor the earth. Even smaller nations were embedding geospatial systems into policing,

border security, urban planning, and disaster response. Yet Nigeria, Africa's most populous country and largest economy, had no clear framework, no dedicated institution, and no consolidated strategy for GEOINT.

1.7. Why GEOINT for Nigeria?

Nigeria's destiny has always been continental and global. With over two hundred million citizens, vast landmass, and critical natural resources, it is a nation too important to be left without the tools of modern intelligence. Yet for decades, we had relied on fragmented mapping agencies, siloed military intelligence, and outdated information channels. The question that haunted me was simple. *“How can Nigeria remain secure, stable, and prosperous in the 21st century without GEOINT?”*

I understood early that GEOINT is not just about spy satellites or classified defense systems. For Nigeria, it is about:

- a) **National Security:** Providing the armed forces and intelligence agencies with precision data for counter-insurgency, counterterrorism, and border security.

- b) **Development Planning:** Guiding urbanization, transportation, energy, and agriculture through accurate spatial data.
- c) **Disaster Preparedness:** Using mapping and real-time data to prevent floods, manage pandemics, and respond to natural disasters.
- d) **Diplomacy and Influence:** Enhancing Nigeria's credibility in the AU, ECOWAS, and UN by contributing GEOINT capabilities to peacekeeping and humanitarian missions.

The realization struck me with urgency, ***without GEOINT, Nigeria is blind in an era where other nations were seeing the world in sharper detail than ever before.***

1.8. The Personal Conviction

My call was not simply technical; it was also deeply patriotic. I understood that nations that mastered GEOINT are nations that protect their sovereignty, safeguard their citizens, and guide their development with precision. For Nigeria to rise, we cannot continue depending on outdated intelligence approaches. At the time, colleagues dismissed the idea as “too advanced” or “a luxury for rich nations.” But I knew

and argued consistently that Nigeria could not afford NOT to embrace GEOINT. For a nation battling asymmetric warfare, porous borders, oil theft, cyber threats, and environmental degradation, GEOINT was not optional, it is existential. The call, therefore, is not just about bringing a modern technology, It is about reshaping how Nigeria thinks about intelligence, decision-making, and governance.

1.9. Defining the Quest

When I accepted this call, I knew it would not be an easy road. I am trying to introduce a new doctrine into Nigeria's security and governance ecosystem. It would mean:

- Convincing policymakers who are often resistant to innovative ideas.
- Overcoming institutional silos where agencies guarded their data jealously.
- Building human capacity in a country where GEOINT training was almost non-existent.
- Securing international partnerships without allowing dependency or exploitation.

It is, in every sense, a pioneer's journey to open the minds of leaders, institutions, and the public to the reality that the

future of intelligence, and by extension national power, lay in GEOINT.

1.10. A Global Responsibility, A Nigerian Mission

I also realized early that this quest is bigger than myself. Nigeria, with its population, geography, and influence, could either become a continental leader in GEOINT or remain vulnerable, dependent, and perpetually reactive. To me, this is more than a professional mission, it is a national duty. Nigeria had answered global calls before, in peacekeeping, in diplomacy, in leading African initiatives, now, Nigeria must answer the call in GEOINT, and I had to be part of that answer.

1.11. Inspiration from Global Movements

The world had already embraced GEOINT as a cornerstone of national security and development. The United States had institutionalized it through the National Geospatial Intelligence Agency (NGA), while other advanced nations had built agencies, policies, and doctrines around it. My exposure to international frameworks, from the United

Nations Committee of Experts on Global Geospatial Information Management (UN–GGIM), the annual Defence Geospatial Intelligence (DGI) conferences in London, to the United State Geospatial Intelligence Foundation (USGIF) annual GEOINT symposium and dialogues in the USA, Europe and Asia. These meets showed me that Nigeria was missing from the conversation. While other nations were integrating satellite data, AI, drones, and spatial analytics into their governance, Africa’s largest economy remained an observer rather than a participant.

I felt a moral and intellectual burden, Nigeria needed not only to participate, but to lead. If we fail to embed GEOINT into our national fabric, we risked perpetual vulnerability. But if we succeed, we could leapfrog development stages and emerge as a continental hub of intelligence driven transformation. And so, the vision was born to plant the seed of GEOINT in Nigeria, nurture it into an institution and elevate it into a national pillar for security, diplomacy, and development.

1.12. Global Recognition:

Nigeria Steps onto the World Stage

GIFON's establishment immediately positioned Nigeria differently:

- For the first time, as an observer GIFON could participate meaningfully in UN–GGIM discussions, not just as a passive attendee but as a knowledge contributor.
- African partners began to look to Nigeria as a leader in the emerging GEOINT sector.
- The global GEOINT community once dominated by Western powers would acknowledge an African voice, backed by a national institution.

1.13. The Personal Legacy:

One Man's Determination

Behind the conferences, frameworks, and institutional charters lies a deeply personal story:

- A man who spent three decades insisting that Nigeria deserved a seat in the global geospatial conversation.
- A scholar who bridged academia, industry, and policy with relentless advocacy.

- A mentor who raised a generation of analysts, officers, and thinkers who now form the backbone of Nigeria's GEOINT capacity.

Dr. Usman's journey is a testament to how one individual's unyielding belief can reshape a nation's trajectory.

PART TWO

NIGERIA'S STRATEGIC CONTEXT

2.1. The National Security Landscape

Nigeria's geography is both a blessing and a burden. Stretching from the Sahel to the Atlantic, bordered by six nations, and endowed with vast resources, Nigeria is strategically located. Yet this geography has also exposed the nation to complex threats:

- a) **Terrorism and Insurgency:** The rise of Boko Haram in the northeast, splinter factions, and the spread of extremist networks posed existential threats to national unity.
- b) **Banditry and Organized Crime:** In the northwest and north-central regions, armed bandit groups exploited ungoverned spaces, leaving communities vulnerable.

- c) **Piracy and Maritime Insecurity:** The Gulf of Guinea emerged as one of the world's most dangerous waters, with piracy undermining trade and energy security.
- d) **Border Control Challenges:** With porous frontiers stretching over 4,000 kilometres, Nigeria struggled to monitor cross-border smuggling, trafficking, and infiltration.
- e) **Cyber and Hybrid Threats:** Increasingly, adversaries combined physical violence with digital warfare, testing Nigeria's weak preparedness.

In this environment, traditional military tactics, boots on the ground, reactive policing, and ad hoc intelligence, proved insufficient. What was missing was the geospatial dimension: the ability to see, map, and predict threats in real-time, integrating terrain, movement, and data into operational strategy.

2.2 The Developmental Dimension

Nigeria's challenges were not limited to security. The struggle for development exposed equally urgent needs for geospatial intelligence:

- a) **Urbanization:** Cities like Lagos, Abuja, Kano, and Port Harcourt were expanding rapidly without effective spatial planning. Informal settlements, traffic chaos, and infrastructure breakdowns worsened by the year.
- b) **Agriculture and Food Security:** With over 70% of Nigerians relying on agriculture, the absence of spatial data limited productivity, crop monitoring, and climate adaptation.
- c) **Energy Infrastructure:** Pipelines, power grids, and refineries suffered constant sabotage and inefficiency. GEOINT could have provided monitoring and predictive maintenance.
- d) **Climate Change and Environment:** Desertification in the north, flooding in the south, and oil spills in the Niger Delta highlighted the urgent need for geospatial monitoring.
- e) **Health and Disaster Response:** During epidemics like Ebola and COVID-19, Nigeria struggled to track spread patterns spatially, a weakness that GEOINT could directly address.

This development, I realized, was itself a national security issue. A nation that could not plan its cities, protect its

environment, or feed its people was a nation perpetually vulnerable. GEOINT is not only about defense; it is about survival and sustainable growth.

2.3 The Intelligence Gap

The most sobering realization came when I examined Nigeria's intelligence architecture. Multiple agencies, military, the police, and civil mapping agencies were all working in isolation. There was no unifying framework, no interoperable data system, and no culture of sharing. The consequences were clear:

- a) **Fragmented Data:** Maps were outdated, incomplete, or held in silos.
- b) **Slow Decision-Making:** Without geospatial analytics, responses to crises were delayed and often misdirected.
- c) **Duplication of Efforts:** Agencies wasted resources building parallel systems.
- d) **Blind Spots:** Critical areas, border zones, maritime corridors, rural conflict areas went unmapped and unmonitored.

This was the gap I sought to fill. I envisioned GEOINT as the bridge that could unify Nigeria's intelligence community, link

security to development, and align national priorities with global best practices.

PART THREE

BUILDING THE FOUNDATION

3.1. The Birth of the Vision: From Concept to Advocacy

Every transformative idea begins as a whisper, a conviction that the world can be different. For me, the idea of embedding **Geospatial Intelligence (GEOINT)** into Nigeria's national fabric began not in a government office or military briefing room, but in quiet moments of reflection. I had seen how nations abroad were harnessing geospatial power to anticipate crises, protect citizens, and drive development. I knew, with absolute clarity, that Nigeria could not afford to be left behind.

The challenge was enormous: GEOINT was unknown in Nigeria. Few policymakers understood it. Fewer still could articulate its value. Introducing it meant starting with **awareness and advocacy**. I began crafting papers, delivering lectures, and speaking wherever an audience could be found, universities, military, conferences, and informal

policy roundtables. In those early years, I encountered scepticism. Some thought GEOINT was “too advanced” for Nigeria. Others dismissed it as a foreign concept irrelevant to African realities. But I pressed on, guided by the conviction that once decision makers grasped its potential, the tide would turn.

3.2. Laying Institutional Roots

I quickly realized that advocacy without structure would fade into noise. Nigeria needed a homegrown institution that would carry the GEOINT torch, an organization that could blend research, training, advocacy, and international collaboration. Out of this conviction was born the Geospatial Intelligence Foundation of Nigeria (GIFON).

GIFON is not just another NGO; it is a movement. Its objectives are clear:

- a) To introduce, define, and institutionalize GEOINT in Nigeria.
- b) To build human capital through training, research, and mentorship.
- c) To integrate defense, security, and development within one geospatial framework.

- d) To position Nigeria within the global GEOINT and geospatial governance community.

The founding was both an act of courage and necessity. With limited resources, I brought together like-minded professionals, young researchers, and visionaries who shared the dream. **Our slogan, “*Mapping the Future. Empowering the Nation,*”** captured both the spirit and the mission.

3.3. International Positioning

Even as we built locally, I knew Nigeria could not afford isolation. GEOINT was global by nature. Data satellites orbited across borders, and international standards governed their use. If Nigeria were to thrive, we had to plug into global conversations. My first steps were to connect with platforms such as the United Nations Committee of Experts on Global Geospatial Information Management (UN-GGIM). I have commenced advocating not just for participation but for leadership. Slowly, doors opened: invitations to meetings, recognition from peers, and opportunities to articulate Nigeria’s potential role.

GIFON has become Nigeria's unofficial voice in GEOINT circles, bridging the gap between our national realities and international best practices. Through publications, partnerships, and conferences, we will position Nigeria not as a passive recipient of global standards but as a potential leader in the African GEOINT space.

PART FOUR

THE STRUGGLES AND BREAKTHROUGHS

4.1 Challenges Encountered

No great vision advances without resistance. As I pushed GEOINT into Nigeria's consciousness, I quickly discovered that the obstacles were as formidable as the opportunities.

a) Bureaucratic Inertia

Government institutions, long accustomed to working in silos, were reluctant to embrace a unifying geospatial framework. Ministries and agencies guarded their turf jealously, often preferring duplication to integration. My proposals were sometimes met with polite nods, but little follow through.

b) Limited Awareness

Among policymakers, GEOINT was an unfamiliar language. To some, it sounded like science fiction. Explaining that it was not merely about satellites, but about integrating geospatial data into national planning, was a battle of patience and persistence.

c) **Funding Constraints**

GEOINT requires investment in data infrastructure, training, and technology. Yet in a country grappling with pressing needs, convincing funders, and government officials to prioritize it was no small task. Resources are scarce, and priorities often shifted with politics.

d) **Institutional Rivalries**

The intelligence and security sectors are notorious for competition. Some actors perceived GEOINT not as a unifying framework, but as a threat to their existing authority. I had to navigate egos, mistrust, and power struggles carefully, without compromising the vision.

e) **The Intellectual Challenge**

The most profound obstacle was psychological: persuading people to think differently. Nigeria had long been reactive, responding to crises after they exploded. GEOINT demanded an initiative taking mindset of predicting, anticipating, and preventing crises. Convincing

a system wired for reaction to embrace anticipation was no small feat.

4.2 Breakthrough Moments

Despite the hurdles, there were moments when the clouds parted, and the vision gained momentum.

a) Recognition by Government Circles

Through persistence, I began to see GEOINT appear in conversations among senior officials. Invitations to security roundtables and policy meetings signalled that the idea was taking root. Each recognition was a victory, however small, against the tide of indifference.

b) Academic and Research Partnerships

Universities and research institutions began to open their doors. Young scholars, eager to contribute to something new, found in GEOINT a fertile field. Training workshops and seminars multiplied, building a pool of early adopters who would carry the movement forward.

c) International Acknowledgment

The most affirming breakthroughs came from outside Nigeria. At global gatherings, when GIFON was mentioned

or Nigeria was acknowledged as part of GEOINT dialogue, it confirmed that we were no longer invisible. International partners began to look to us for collaboration.

d) **Pilot Programs and Proof of Concept**

Small but significant projects, mapping exercises, early-warning prototypes, and training modules, demonstrated that GEOINT was not abstract theory, but practical reality. These proofs of concept silenced doubters and gave credibility to the cause.

4.3 The Human Capital Battle

A vision without people is a dream unfulfilled. I knew that to sustain GEOINT in Nigeria, we needed more than policy and institutions; we needed people, skilled, enthusiastic, and visionary. I began to focus intensely on human capital development:

- a) **Mentoring the Next Generation:** Young Nigerians were introduced to GEOINT through lectures, internships, and workshops. A growing number have found in it, not just a career path, but a sense of national mission.
- b) **Building Networks:** Communities of practice has begun to emerge, geographers, defense analysts, software

engineers, environmental scientists are all converging around the GEOINT idea.

- c) **Creating Ownership:** By making young Nigerians stakeholders in the vision, GEOINT will cease to be “my idea” and become “our mission.”

I came to understand that the most powerful satellite or software is meaningless without the human mind trained to use it. Nigeria’s greatest GEOINT asset was not in the skies or in data centers, but in the minds of its people.

PART FIVE

THE ARCHITECTURE OF GEOINT NIGERIA

5.1. The National GEOINT Framework

Every enduring idea must be translated into a structure, a framework that outlives individuals and moments. For Nigeria, my task is to define a **National GEOINT Framework** that could:

- a) **Unify Intelligence Efforts:** Break down the silos between the armed forces, police, and civil mapping institutions etc.

- b) **Standardize Data:** Ensure that mapping, imagery, and geospatial data followed common standards, accessible across agencies.
- c) **Drive Policy:** Influence government decisions with geospatial evidence, not guesswork.
- d) **Institutionalize GEOINT:** Anchor geospatial intelligence within laws, doctrines, and national strategies, making it a permanent part of Nigeria's governance fabric.

At its heart, the framework is about integration. GEOINT is not another agency or bureaucracy; it is the glue connecting security, diplomacy, development, and innovation.

5.2 Building Infrastructure for GEOINT

For GEOINT to thrive, Nigeria needed more than vision; it needs infrastructure. I have been advocating for a layered architecture that include:

- a) **National Geospatial Data Centers:** Secure repositories where satellite imagery, mapping data, and analytics could be stored and shared.
- b) **Integration with Satellites:** Leveraging Nigeria's satellites (like NigeriaSat-1 and subsequent space programs) for domestic intelligence and development.

- c) **Drone and UAV Systems:** Affordable, flexible tools for real-time mapping of conflict zones, borders, and disaster sites.
- d) **Artificial Intelligence and Big Data Analytics:** To move beyond static maps into predictive models, forecasting insurgent movements, monitoring floods, or anticipating urban growth.
- e) **Secure Networks:** Ensuring data sovereignty and cybersecurity protection against external manipulation or espionage.

I often argued that investing in GEOINT infrastructure was not a luxury, but a form of national insurance. It prevents losses that would otherwise drain the economy, from oil pipeline sabotage to poorly planned cities.

5.3. Critical Infrastructure Protection

One of the strongest cases for GEOINT in Nigeria is its direct application to Critical Infrastructure Protection (CIP). Nigeria's economy and survival depend on thirteen (13) critical sectors, each vulnerable to threats. GEOINT offered a unifying solution:

- a) **Defense & Security:** Real-time mapping of insurgent zones, troop movement planning, and precision targeting.
- b) **Energy:** Monitoring pipelines, detecting sabotage, and managing power grids.
- c) **ICT & Cyber:** Mapping digital vulnerabilities and integrating cyber-physical threat assessments.
- d) **Transportation:** Securing airports, seaports, and road networks.
- e) **Water Resources:** Tracking dams, rivers, and flood risks.
- f) **Food & Agriculture:** Crop monitoring, food supply chain mapping, and early warning systems for famine.
- g) **Health:** Spatial tracking of disease outbreaks, health facility accessibility, and vaccination coverage.
- h) **Finance:** Monitoring infrastructure critical to banking and stock exchanges.
- i) **Emergency Services:** Real-time disaster response coordination.
- j) **Manufacturing:** Securing production hubs and industrial clusters.

- k) **Chemical & Biological:** Hazard mapping of sensitive facilities.
- l) **Government Facilities:** Protecting key government institutions and leadership centers.
- m) **Public Safety:** Monitoring urban crime trends and crowd control for events.

By linking GEOINT to these sectors, I am able to demonstrate to leaders that this was not just “another idea”, it was a national necessity.

PART SIX

GEOINT AS A DRIVER OF NATIONAL TRANSFORMATION

6.0. Defense and National Security

At the core of GEOINT’s value lies its ability to safeguard the state. Nigeria’s security challenges are diverse, but each one can be transformed through geospatial intelligence.

6.1. Counterterrorism and Counterinsurgency

The fight against Boko Haram and other insurgent groups revealed how costly it is to operate without accurate, real-time geospatial awareness. Troops moved into unfamiliar terrain blind, while insurgents exploited forests, rivers, and villages to their advantage. With GEOINT, every movement could be mapped, every terrain analysed, and every operation guided with precision.

- a) UAV imagery could identify insurgent hideouts in Sambisa Forest.
- b) Heat maps could track migration patterns of displaced populations.
- c) Predictive analytics could forecast insurgent routes before attacks happened.

6.2. Border Management

Nigeria's porous borders had long been exploited by smugglers, traffickers, and foreign fighters. GEOINT provided tools to monitor border zones in near real-time, linking satellite imagery with patrol routes, and integrating biometric checkpoints into spatial databases.

6.3 Maritime Domain Awareness

The Gulf of Guinea, critical for Nigeria's oil exports and global trade, suffered rampant piracy. GEOINT offered the ability to track vessel movements, detect unusual patterns, and coordinate naval responses with precision.

In all these cases, GEOINT is not a replacement for traditional military strength, but a force multiplier, ensuring that every bullet, every patrol, and every operation is guided by intelligence, not guesswork.

6.4 Diplomacy and Global Standing

Security is only part of the story. For Nigeria, GEOINT can become a tool of diplomatic influence and global credibility.

- a) **African Union & ECOWAS:** Nigeria, as West Africa's leader, needed to offer more than troops to regional crises. By contributing geospatial analysis to ECOWAS peace missions, Nigeria would lead with intelligence, not just workforce.
- b) **United Nations:** During UN peacekeeping operations, countries with GEOINT capacity often set the agenda. By bringing GEOINT to UN missions, Nigeria would elevate its voice at the Security Council and beyond.

- c) **Soft Power:** Offering geospatial insights on climate change, humanitarian crises, or disaster response positioned Nigeria as a responsible global actor, shifting its image from a nation of problems to a nation of solutions.

I often argued that GEOINT is as much about diplomacy as it is about defence, it is a part of Nigeria's ticket to the global table of GEOINT knowledge driven nations.

6.5. Developmental Leapfrogging

The most profound promise of GEOINT lay in its power to drive Nigeria's development agenda.

a) Agriculture and Food Security

GEOINT enabled precision agriculture, using satellite imagery and drones to monitor soil moisture, crop health, and seasonal patterns. With this, Nigeria could feed itself, reduce imports, and stabilize rural economies.

b) Urban Planning and Smart Cities

Cities like Lagos and Abuja were growing chaotically. GEOINT offered the chance to plan smarter, mapping

transportation flows, infrastructure gaps, and housing needs before chaos became unmanageable.

c) Disaster Preparedness and Environmental Management

Floods in Lokoja, desertification in the north, and oil spills in the Niger Delta highlighted Nigeria's environmental vulnerabilities. GEOINT-based early warning systems could save lives, protect assets, and reduce recovery costs.

d) Energy and Infrastructure

Nigeria's electricity grid, pipelines, and transportation networks could be monitored and secured with geospatial tools, reducing sabotage and inefficiency.

e) Public Health

From Ebola to COVID-19, Nigeria struggled to track and respond to epidemics. GEOINT enabled spatial mapping of outbreaks, distribution of medical supplies, and assessment of healthcare access.

In each of these areas, GEOINT has been the missing link, the invisible architecture that could transform policy into progress.

PART SEVEN

THE FUTURE AND YOUR LEGACY

7.1 Institutionalizing GEOINT in Nigeria

For GEOINT to survive beyond advocacy and pilot programs, it had to be institutionalized. My vision was never about a single individual or organization; it was about embedding GEOINT into the DNA of Nigeria's governance and security. This means:

- a) **Policy Integration:** GEOINT must be written into Nigeria's national security strategy, development plans, and legislative frameworks.
- b) **Permanent Structures:** Establishing a National GEOINT Agency or Directorate with a clear mandate, budget, and interagency authority.
- c) **Education and Training:** GEOINT curricula in universities, defense academies, and civil service institutions to ensure continuous skill development.
- d) **National Data Sovereignty:** Protecting Nigeria's geospatial data from external dependence, ensuring that critical national information remained in Nigerian hands.

- e) **Public–Private Collaboration:** Leveraging Nigeria’s private sector, tech innovators, and startups to develop indigenous solutions for GEOINT challenges.

By embedding GEOINT into systems and structures, Nigeria would never again be blind in a world driven by data.

7.2 Africa and the Global South

Nigeria’s quest for GEOINT is not just about Nigeria. I envisioned it as a continental responsibility. With its size, population, and influence, Nigeria is uniquely positioned to become Africa’s GEOINT hub.

- a) **Regional Leadership:** Training and supporting ECOWAS states to adopt GEOINT, creating a cooperative regional intelligence framework.
- b) **African Union:** Contributing geospatial intelligence to AU peace and security missions, climate monitoring, and infrastructure planning.
- c) **Global South Collaboration:** Partnering with countries in Asia and Latin America facing similar developmental and security challenges, sharing knowledge and solutions.

In this vision, Nigeria's rise in GEOINT would lift Africa's collective capacity, shifting the continent from dependency to innovation.

PART EIGHT

CONCLUSION

8.0 Reflections and Legacy

As I look back on this quest, I see not just policies, institutions, and frameworks, but a personal journey of conviction, resistance, and perseverance.

- a) **Triumphs:** Seeing GEOINT a part of Nigeria's national conversation, witnessing young Nigerians embrace the field, and representing Nigeria on global platforms.
- b) **Regrets:** The years lost to bureaucratic delays, the moments when resources fell short, and the opportunities that could have been seized earlier.
- c) **Lessons:** Change requires both vision and persistence. Great ideas rarely succeed at first introduction, but with time, consistency, and passion, they take root.

My legacy, I hope, will not be the founding of an institution alone, but the awakening of a national consciousness, that intelligence, when fused with geospatial power, is the compass by which a nation navigates its security, diplomacy, and development. I leave this quest with a call to action, to the next generation of Nigerians and Africans. The world is moving faster than ever, driven by data, technology, and foresight. We cannot afford to lag. GEOINT is not the future; it is the present. The baton is now yours to carry.

Thank you.

God Bless you

and God Bless the Federal Republic of Nigeria.
